Chart 1: Main Program Flowchart

Menu-driven loop of the Disaster Management Resource Management System

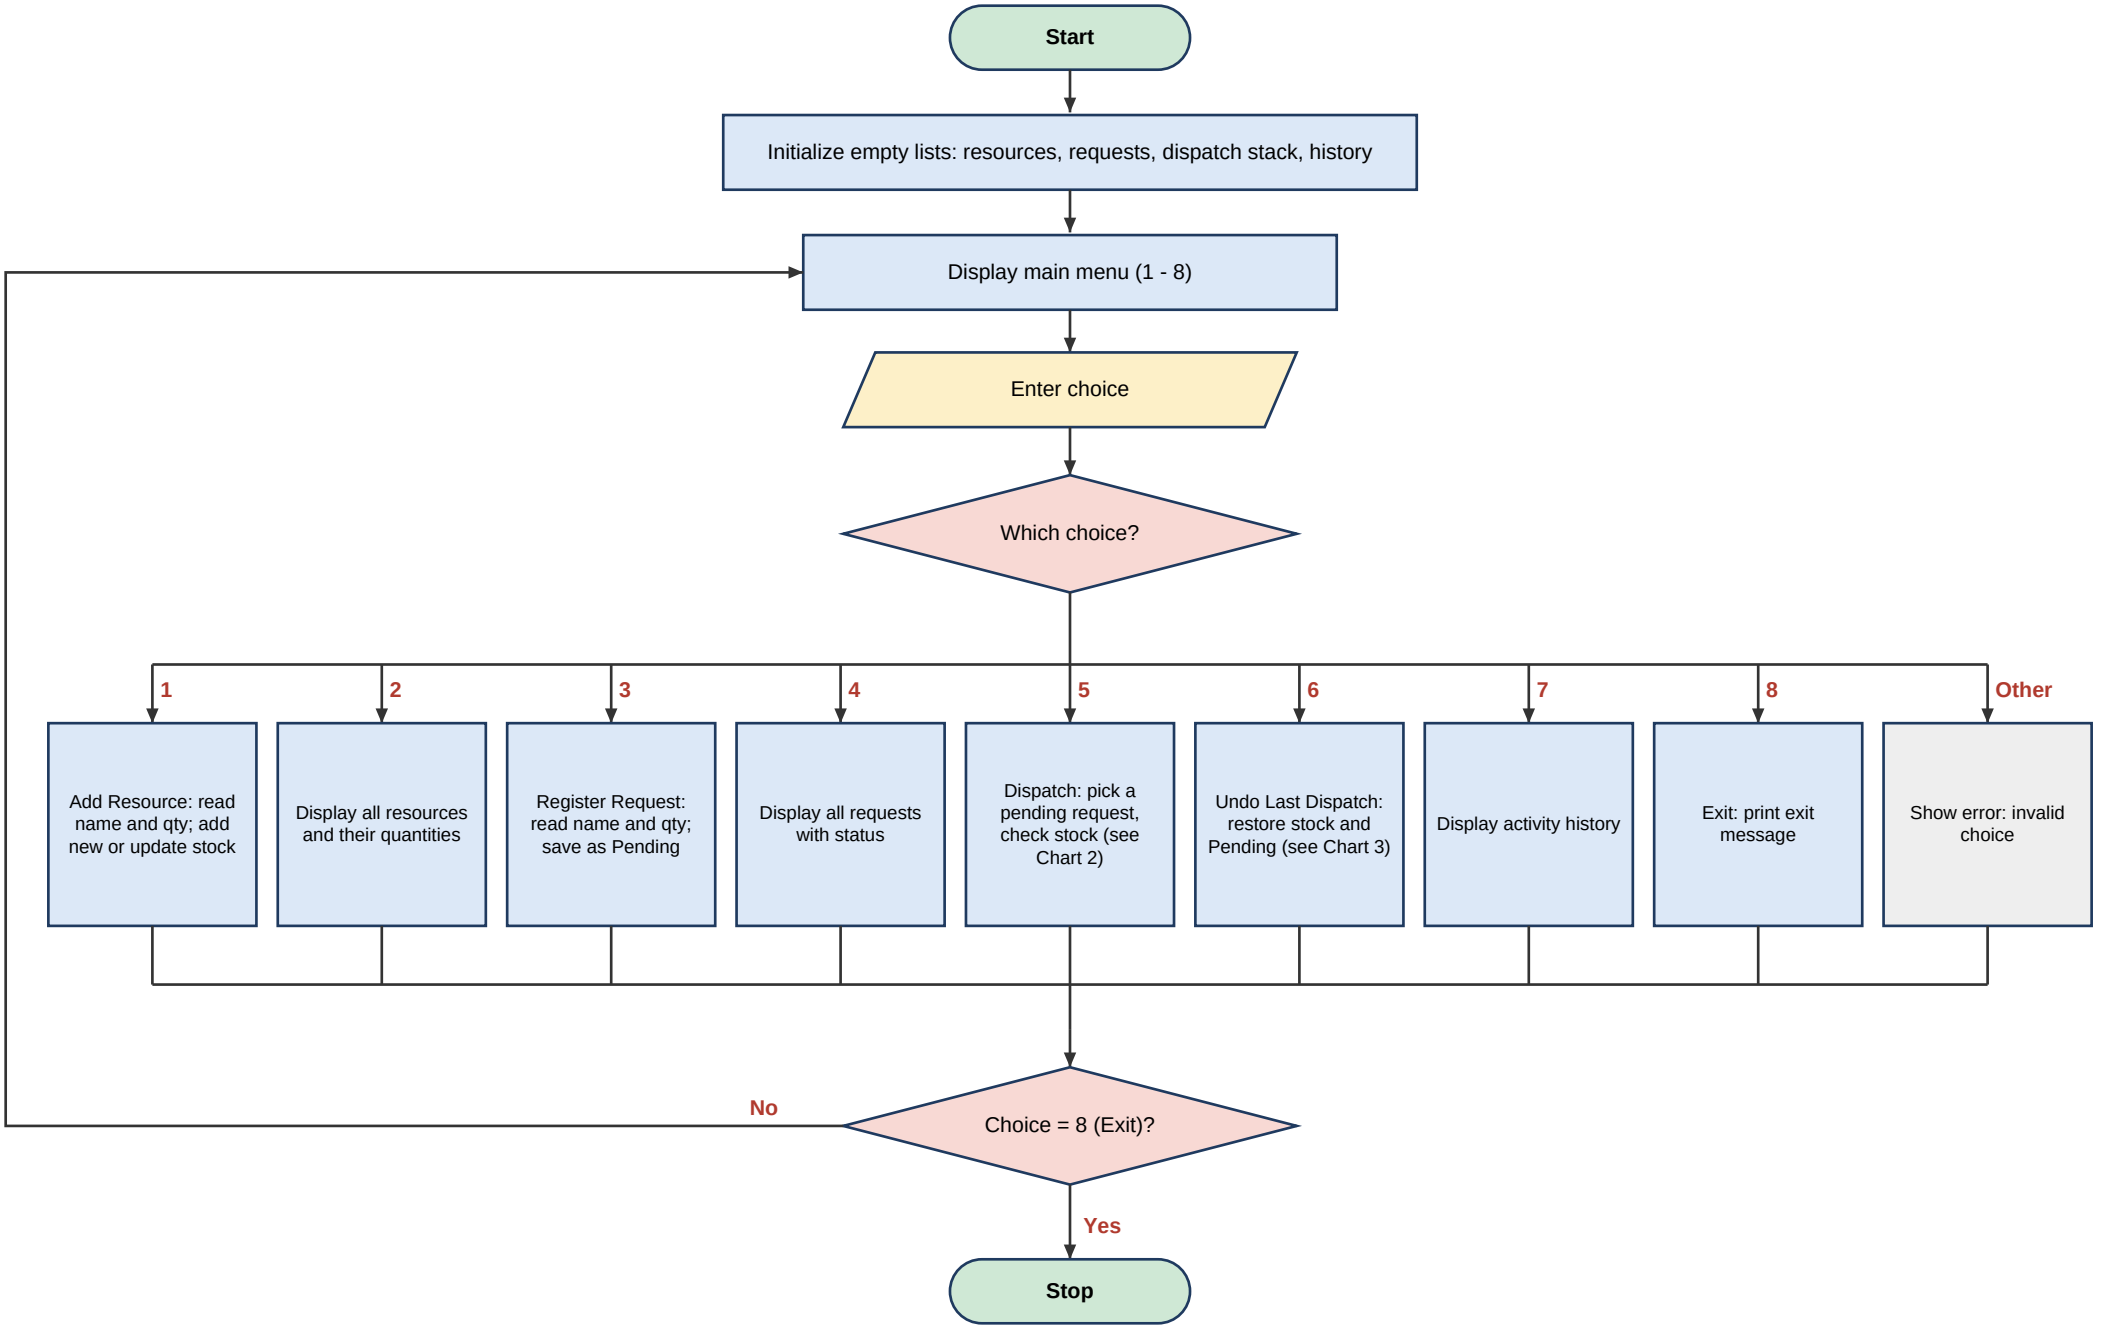

Chart 2: Dispatch Resource

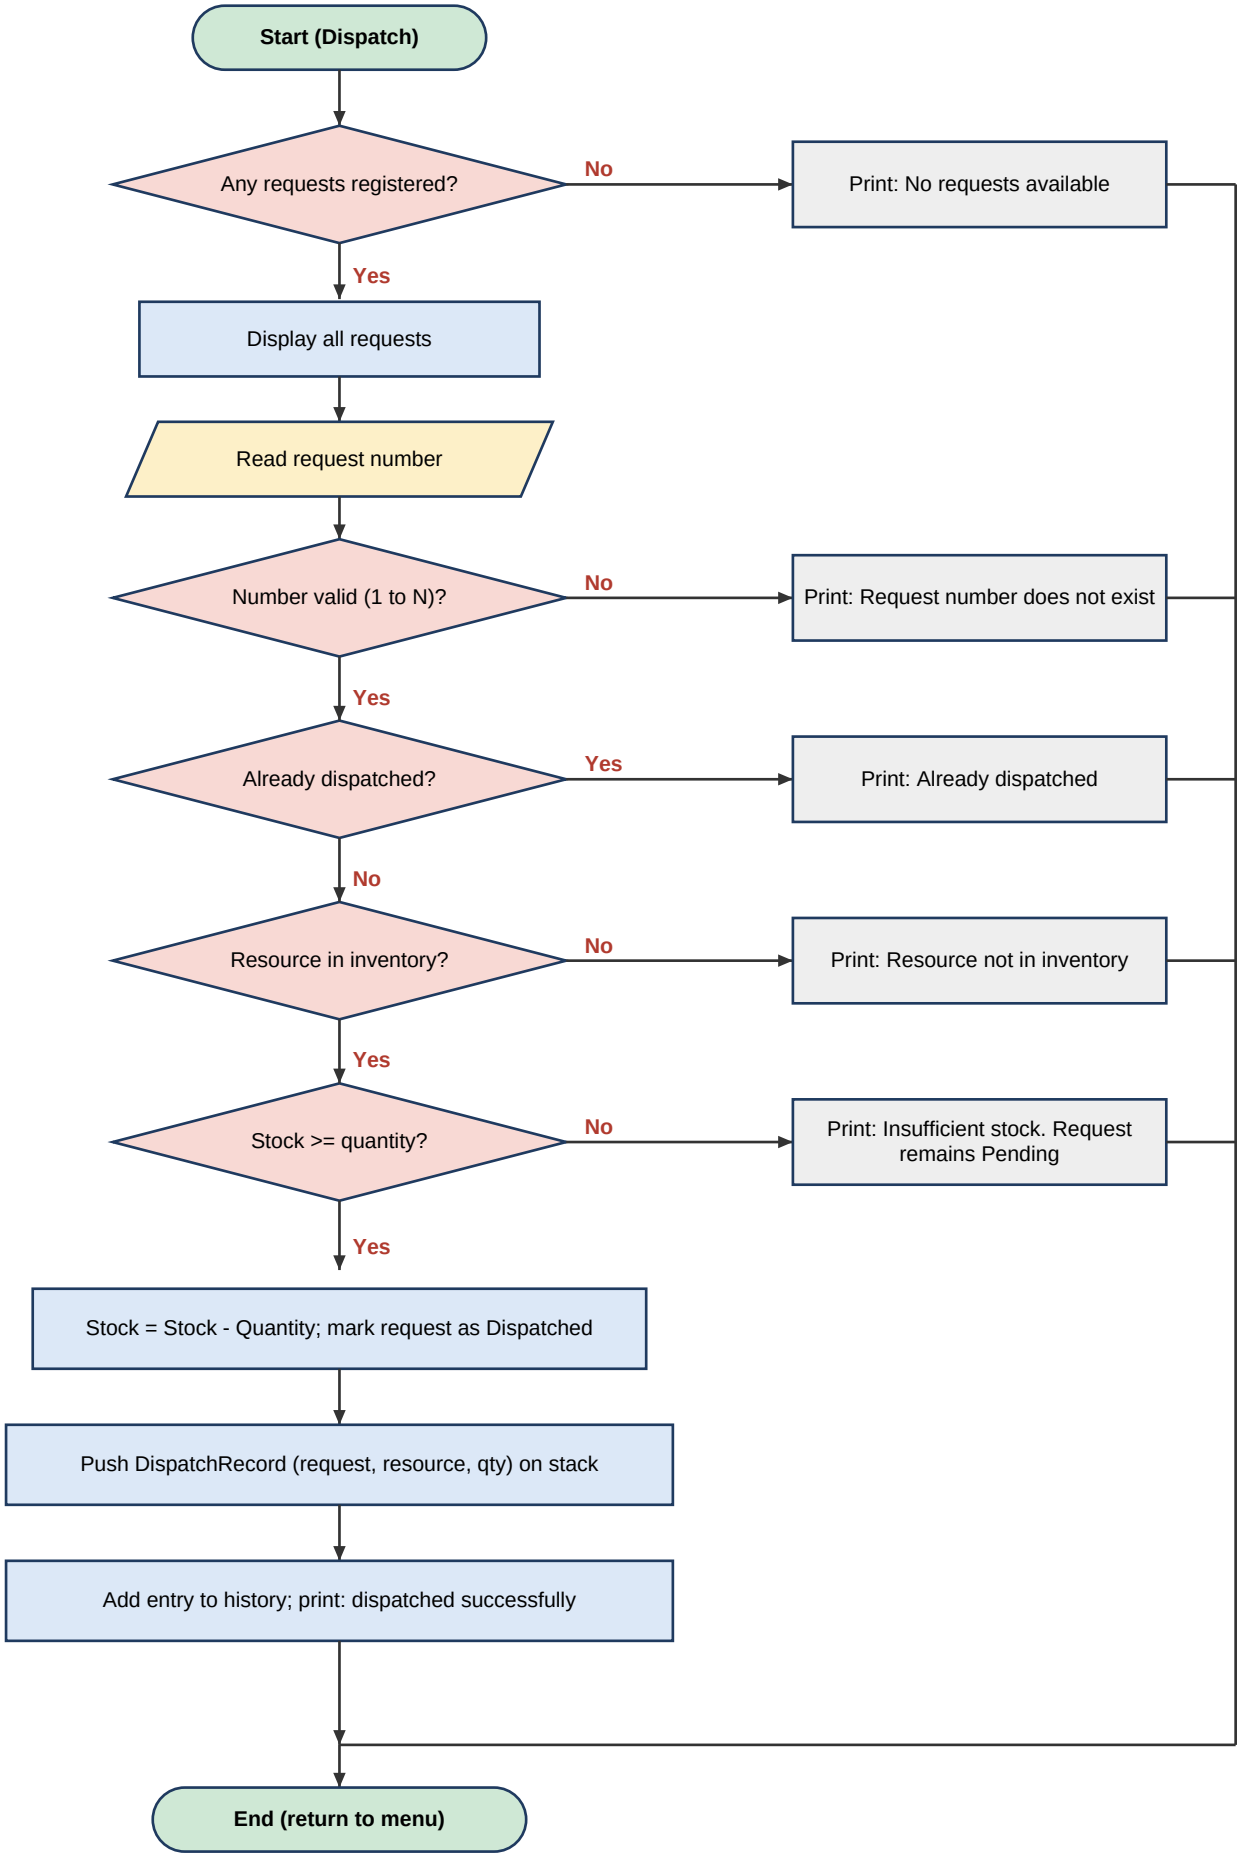
Fulfil a pending request when sufficient stock is available

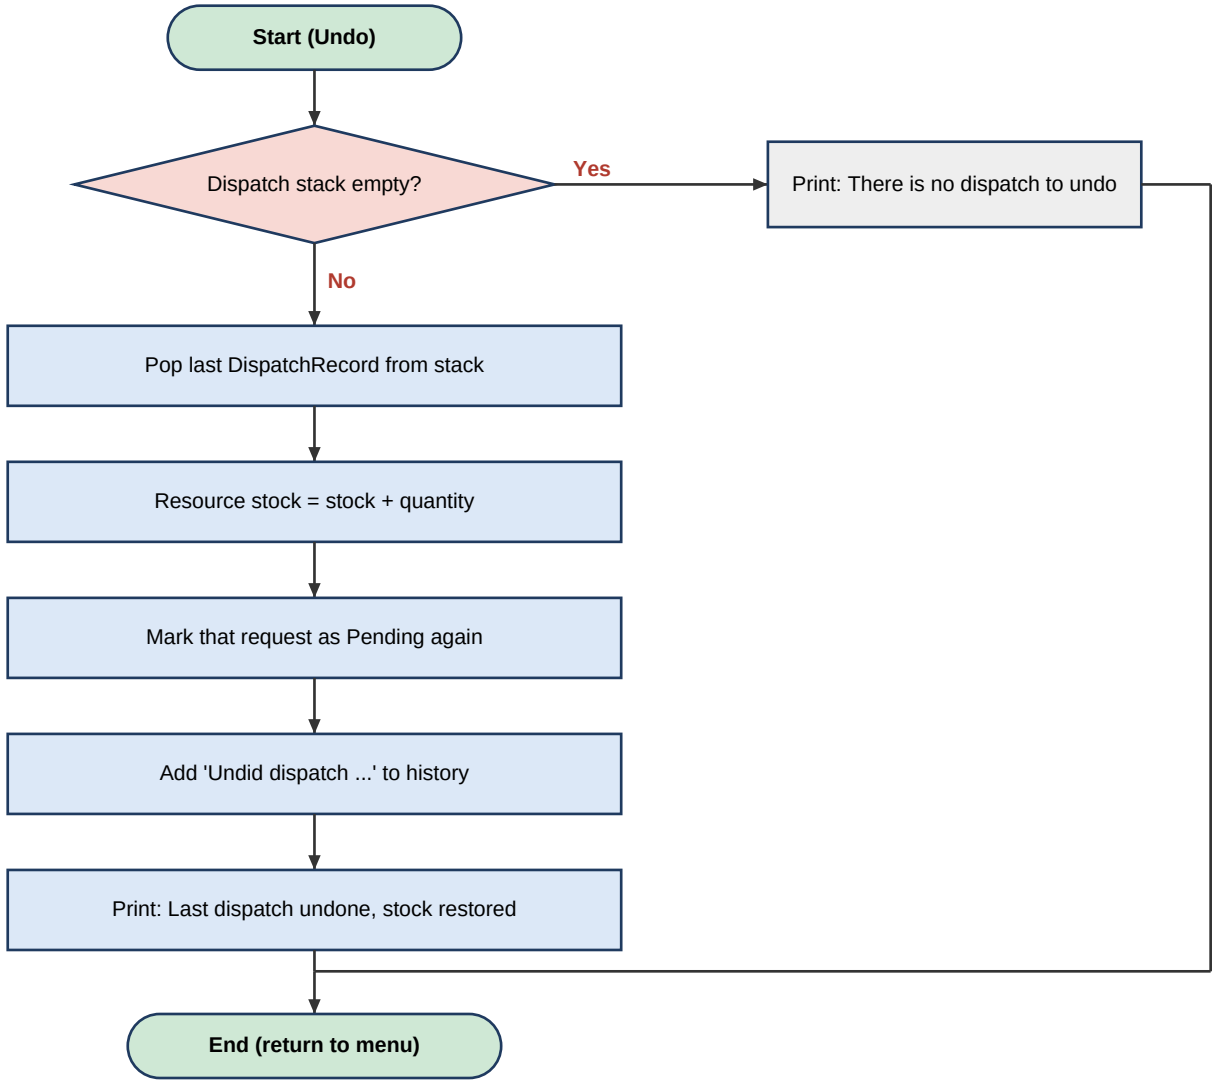


Notes

- Every error path leaves stock and request status unchanged.
- A request that fails for low stock stays Pending and can be dispatched later after more stock is added.
- The DispatchRecord pushed here is what makes 'Undo Last Dispatch' possible.

Chart 3: Undo Last Dispatch

Reverse the most recent successful dispatch (stack - LIFO)



Example of Dispatch followed by Undo

Step	WaterBottle stock	Request 1 (50 units)	Stack
After Add Resource (200)	200	-	empty
After Register Request	200	Pending	empty
After Dispatch	150	Dispatched	1 record
After Undo Last Dispatch	200	Pending	empty
